This collection of information is required by 37 CFR 1.133. The information is required to obtain or retain a benefit by the public which is to file (and by the USFTO to process) an application. Centificientally vs governed by 35 U.S.C. 112 and 37 CFR 1.11 and 1.14. This collection is estimated to take 21 minuted to technique, including gathering, preparing, and submitting the completed application form to the USFTO. This well vs vs dynamics upon the individual case. Any commences to the answard of time you require to either form and or Supremental for the process of the completed application. Supplementally the completed application of the completed application of time you require to either form and or supremental for the process of the completed application. Supplementally the completed application of the process of the public vs. 11 and 1.14. This collection is estimated to take 21 minuted to execute the complete process. The vs. 11 and 1.14. This collection is estimated to take 21 minuted to execute the complete publication. The vs. 11 and 1.14. This collection is estimated to take 21 minuted to execute the public vs. 11 and 1.14. This collection is estimated to take 21 minuted to execute the complete publication. The vs. 11 and 1.14. This collection is estimated to take 21 minuted to execute the public vs. 11 and 1.14. This collection is estimated to execute the public vs. 11 and 1.14. This collection is estimated to execute the public vs. 11 and 1.14. This collection is estimated to execute the public vs. 11 and 1.14. This collection is estimated to execute the public vs. 11 and 1.14. This collection is estimated to execute the public vs. 11 and 1.14. This collection is estimated to execute the public vs. 11 and 1.14. This collection is estimated to execute the public vs. 11 and 1.14. This collection is estimated to execute the public vs. 11 and 1.14. This collection is estimated to execute the public vs. 11 and 11

FOR DISCUSSION ONLY

PROPOSED AMENDMENTS

Regarding the rejection under 35 USC § 101, please consider the following proposed amendments.

- A. "using . . . apparatus to perform the steps. . ."
- B. 1. (currently amended) A counterfeit eye discrimination method comprising the steps of:

receiving image data of an image <u>captured from a living eye or a</u> reproduction of a living eyeincluding an eye; and

detecting presence or absence of roughness in the image by image processing to the image data;

wherein the <u>image</u> eye-is judged to be-a-counterfeit eye that is <u>have</u> <u>been captured from</u> a reproduction of a living eye when roughness is detected in the image.[[.1]]

performing an authentication operation in response to the judgment.

Regarding the rejections under 35 USC § 102 & 103, please consider the following proposed amendments.

C. 1. (currently amended) A counterfeit eye discrimination method comprising the steps of:

receiving image data of a photocopy image including an eye; and detecting presence or absence of roughness in the image by image processing to the image data, wherein pixel values of the image intrinsically determines a statistical variance of the pixel values, wherein the statistical variance conclusively determines the roughness;

wherein the eye is judged to be a counterfeit eye that is a reproduction of a living eye when roughness is detected in the image.

- D. We further propose to define the term "roughness" as follows:
 - a) The roughness is on the surface of the image.
 - b) The roughness is caused by ink or toner on a printer output.
 - c) The roughness is of intensity data of the image.
- d) The roughness is caused by repetition of a specific intensity pattern on the image.
- E. In contrast, Daugman at best discloses a) generating an identification iris code vector for an iris image captured and b) then comparing the identification iris code vector with reference iris code vectors in a library to calculate Hamming

FOR DISCUSSION ONLY

distances, which are allegedly analogous to the claimed roughness. <u>Daugman</u>, col. 3, Ins. 1-36. In other words, the Hamming distances are not <u>conclusively</u> determined by the data of the iris image captured; the Hamming distances also depend on the reference iris codes.

Further, the above method of Daugman is to determine the identity of an iris. The iris image is presumed to be captured from a living eye. Daugman uses a different method, which monitors the pupillary diameter over time, to determine if the image is captured from a living eye or a photograph of a living eye. Daugman, col. 6, Ins. 38-61. This method takes more than one image, and thus does not determine a reproduction conclusively from the data of a single image.

F. Regarding "detecting presence or absence of roughness" in the claims, we stated in the previous response that the small-scale variation between the reference code and the present code in Daugman differs from roughness in the image. But the Examiner has presented no statement for this argument.
